Ripper reel for tough-headed compositae species such as *Echinacea*, *Silphium*, *Rudbeckia* & *Helianthus*

Prairie Habitats Inc.'s primary goal is to conserve biological diversity by encouraging the use of locally collected seed in ecological restoration and reclamation. Our innovative native seed harvesting equipment was developed right here in our own tall grass prairie nursery and on rugged tall grass prairie remnants in Manitoba, Canada. We still use them today. They allow the efficient collection of local native seed while ensuring the preservation of the areas being harvested.

For 18 years we have been working with conservation agencies, restorationists and native seed producers around the world to refine and improve our technology. Prairie Habitats Inc.'s native seed harvesters now are in use in 17 countries. They have proven themselves in many different harvest applications for over 250 species. We look forward to helping you restore endangered native grasslands.
